When You Purchase an ENERGY STAR® Qualified Clothes Washer

Did you know clothes washers use about 26% of the hot water in your home? If your clothes washer is 10 years old or older, it's time to replace it with a new ENERGY STAR® qualified model and start saving energy and water every time you do a load of clothes. Gain the satisfaction of preserving a valuable natural resource for you, your community and our world.

Breakdown of hot water usage in a typical home.
Data Source: US Dept. of Energy

Saving Water *and* Energy is like Finding Money

- ◆ Is your washer is more than 10 years old? Washers manufactured before 1998 are significantly less efficient than newer models.
- ◆ **Save 8 gallons of water** every time you wash with an ENERGY STAR® qualified clothes washer. This directly affects your monthly water and sewage costs.
- ◆ ENERGY STAR® models flip and spin clothes to reduce damage and **lengthen the life of your clothes**. Standard washers with agitation pull and twist clothes to get them clean, breaking down fibers in the process. You'll see the evidence in the amount of lint in your dryer.
- ◆ **More capacity means fewer loads of laundry each week.** Without a bulky agitator, there is more usable space in the washer for laundry—especially for larger items like blankets and comforters.
